

## Tracking Your Lima Bean Growth

There are many ways you can track the growth of your lima beans.

- Keep a daily journal to track care given and growth progress.
- Draw or take photos each day. Photos could be turned into a time-lapse video.
- Measure root length and/or stem length in a table or line graph.
  - If you planted in a plastic bag or clear container, you should be able to see root growth.
  - Use the table and graph below or go digital with a spreadsheet.
- Keep track of the number of leaves each day.
- **Don't forget to share your findings with us in the comment section of the video on our Facebook page!**

Change it up!

- Make comparisons between the beans planted in soil versus wrapped in a wet paper towel.
- Plant more and experiment with different amounts of sunlight, different amounts of water, or different types of soil.
- What other beans can you plant to watch grow?
- Are there other foods you can grow?
- What happens when you plant a peanut?
- Are there seeds in your surroundings that you can plant to watch grow?
